MBA 530 Donnor Company part I

1.) Normal process flow? Draw process flow diorom

2.) What orders would you schedule on the Microme jr. CNC drill? CNC router?

3.) Standard production time 8 circuit boards one panel? 40? 200? 800?

4.) Capacity of the electroplate operation?

5.) capacity utilization? 1987

flow of the production system

1.) 1. recieve Master artwork

2. Repeat image 8x to fill panel

? 3. inspect raw materials for defects

? 4. copper is sheared into 12x8 panels

? 5. location holes are punched

image transfer

6. Drill holes based on Master

manual Drill processes

CNC machine

7. operator pins a panel to drill panel using holes

8. Panel is processed through a copper immersion bath

Part 2

1) "information system"
↳ Flaherty's mind

① customer sends order [via ?]

② Flaherty receives order

③ waits raw materials

④ Estimates labor

⑤ guesses

⑥ sends order

⑥ gives info to people

2) No.

① raw materials

② sals delays

③ rush orders

④ rework on design

⑤ I/A from customer eng

Actions ① accurately forecast raw materials
= no more waiting

② doesn't go to factory unless it's sold?

③ accurately predict total rush orders?
plan capacity for rush orders

④ Break some supply chains into custom design
so that normal orders aren't affected.

⑤ Can't take on order if lacking customer review

Operations

quality - poor

Delivery - delay →

anabel

(1) Effective operating

1. deliver to customers

2. create value for the org

(2) Operating capability

(1) operating system Fundamentals

(2) designing for operational tranformation

(3) managing supply chains

(4) Leading product development

(5) COO/CEO

'Dutch Uncle' talk

▽ = Raw work in progress

▭ = tasks

◇ = decisions

∅ idle time

context due

idenfy bottleneck → you are the bottleneck

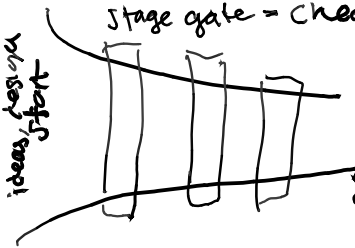
longest cycle time

Throughput is from recieving raw to complete

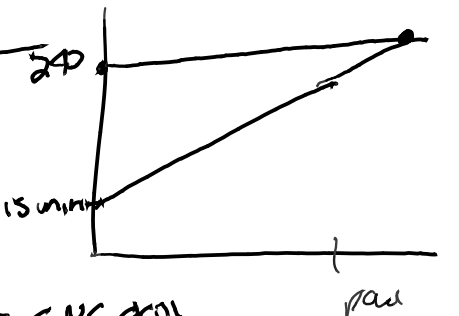
Start to finish

Product development funnel

Stage gate = checkpoint



$y = mx + b$

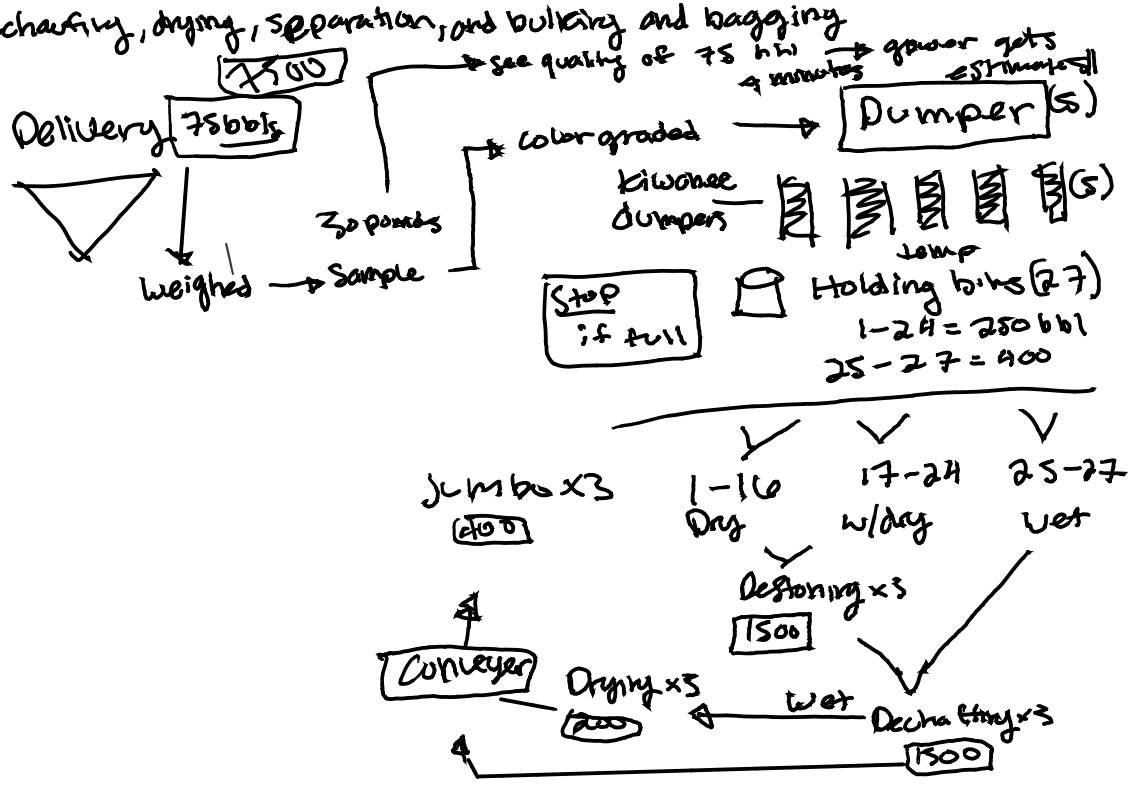


manual = CNC drill

$$\frac{\text{Time used}}{\text{Time available}} = \boxed{\text{utilization}}$$

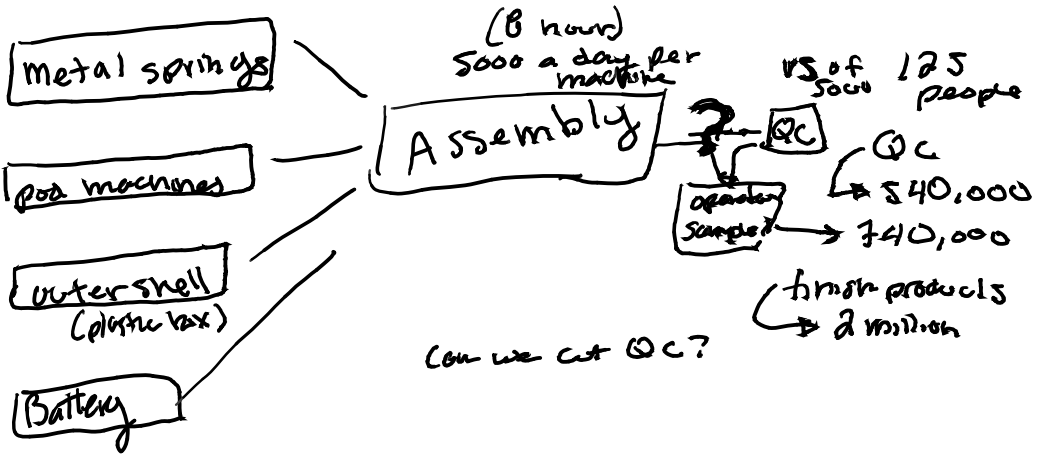
1. Recieving/testing 2. Duping (3). temporary holding (4), destoning
dechaffing, drying, separation, and bulking and bagging

18,000 per day, 70%. what, 11 hr day



290 per da

12,600 bbl wet
5400 dry



metal springs
